

Multi-Line Insurance Policy and Claims Management System

User Story:

The Multi-Line Insurance Policy and Claims Management System is designed to provide a centralized Salesforce-based solution for managing Vehicle, Property, and Life Insurance policies and claims.

The system enables insurance agents to create and manage policy information using a flexible data model with policy-specific Record Types and Field Sets.

Guided Screen Flows simplify policy quoting, while Apex automation calculates premiums based on policy and vehicle details.

Claims are automatically routed to the appropriate queue based on policy type. High-value claims are processed through an approval workflow involving Senior Adjusters and Claims Managers.

An LWC-based Claims Dashboard provides adjusters with a focused view of their assigned claims, including:

- Claim Amount
- Policy Type
- Policy Holder
- Approval Status
- Days Open
- The system improves:
 - Policy processing efficiency
 - Claim handling
 - Data accuracy
 - Operational visibility
 - Customer service

1.INTRODUCTION:

1.1 Project Overview:

The Multiple Insurance Policy and Claims Management System is a web-based application designed to provide a simple and organized interface for managing different types of insurance policies and claims.

The system provides a centralized platform where users can view policy information, register insurance policies, search policy details, submit claims, and track claim status.

The main focus of the project is to make insurance-related activities easier, faster, and more organized through a user-friendly web interface.

1.2 Purpose of the project:

- The purpose of this project is to develop a digital interface that simplifies the management of multiple insurance policies and claims.
- Instead of maintaining separate paper documents or manually searching through records, users can access the required information through different modules of the application.

1.3 Objectives:

The major objectives of the project are:

- To provide a centralized insurance management interface.
- To manage multiple insurance policy categories.
- To display policy information in an organized format.
- To provide a simple claim registration interface.
- To allow users to track claim status.
- To provide search and filtering facilities.
- To reduce manual paperwork.
- To improve accessibility of insurance information.
- To create a responsive and user-friendly interface.
- To provide a foundation for future backend integration.

2. IDEATION PHASE:

2.1 Problem Identification:

- Managing insurance information manually can become difficult when the number of customers and policies increases.

- Important information such as policy number, premium, coverage, expiry date, customer details, and claim information may be stored in different documents.

This can result in:

- ✓ Difficulty in finding policy information.
- ✓ Repeated data entry.
- ✓ Loss or duplication of records.
- ✓ Difficulty tracking claims.
- ✓ Increased paperwork.
- ✓ Time-consuming manual processes.

Therefore, a centralized insurance management application can provide a better way to organize this information.

2.2 Existing System:

In a traditional insurance management process:

- Policy information may be maintained manually.
- Customer information may be stored separately.
- Claims may require physical documentation.
- Searching old records can take more time.
- Claim status may not be easily visible.
- Manual processing can result in errors.

2.3 Proposed System:

The proposed system provides a single web interface for managing insurance policies and claims.

The application includes:

- ✓ Dashboard
- ✓ Policy Management
- ✓ Customer Information
- ✓ Insurance Categories
- ✓ Claim Registration
- ✓ Claim Status
- ✓ Search and Filter
- ✓ Policy Details

✓ Claim History

The proposed system provides a structured and easy-to-use interface for insurance-related activities.

2.4 Target Users:

The system can be used by:

Customer

- View policy information.
- Submit claims.
- Check claim status.
- View policy details.

Insurance Agent

- Register customer policies.
- View policy information.
- Update policy details.

Claim Officer

- View submitted claims.
- Check claim information.
- Update claim status.

Administrator

- Monitor policies and claims.
- View overall system information.
- Manage application-level information.

3. REQUIREMENT ANALYSIS PHASE:

3.1 Customer Journey Map:

The Customer Journey Map describes the steps followed by a customer while using the Multiple Insurance Policy and Claims Management System.

Stages:

1. Access
2. Explore
3. Select Policy

4. Policy Registration
5. Policy Review
6. Claim Submission
7. Claim Tracking
8. Claim Resolution
9. History

3.2 Solution Requirements:

Functional Requirements:

FR No	Functional Requirement	Description
FR01	Insurance Category Selection	The system should allow users to select different insurance categories
FR02	Policy Registration	The system should provide a form to enter new policy information
FR03	Customer Information	The system should capture basic customer details
FR04	Policy Display	The system should display registered policies in an organized format
FR05	Policy Search	Users should be able to search policies using policy number, customer name, or other available information
FR06	Policy Filtering	Users should be able to filter policies based on category or status
FR07	Policy Details	The system should display complete information about a selected policy
FR08	Policy Update	Users should be able to edit available policy information
FR09	Claim Registration	The system should provide a form for registering a new insurance claim
FR10	Claim Information	The claim form should collect details such as: Claim Number, Policy

		Number, Claim type, date, amount, etc.,
FR11	Claim List	The System should display submitted claims
FR12	Claim Search	Users should be able to search for claims
FR13	Claim Status	The system should display the current status of a claim
FR14	Form Validation	The system should validate required fields before accepting form information
FR15	Dashboard	The system should provide summary information about policies and claims
FR16	Responsive Navigation	The application should provide easy navigation between different modules

Non-Functional Requirements:

Non-functional requirements describe how well the Multiple Insurance Policy and Claims Management System should work.

- Usability – The system should be simple and easy to use for customers and staff.
- Performance – Pages, policy details, and claim information should load quickly.
- Responsiveness – The application should work properly on desktops, laptops, tablets, and mobile devices.
- Reliability – The system should provide consistent results and avoid unnecessary errors during normal usage.
- Compatibility – The application should work correctly in commonly used web browsers such as Chrome, Edge, and Firefox.
- Maintainability – The HTML, CSS, and JavaScript code should be organized so that future changes can be made easily.
- Accessibility – Text, buttons, forms, and navigation should be clear and easy to understand.
- Validation – User inputs should be checked before displaying or processing policy and claim information.
- Scalability – The design should allow future features such as database connectivity, user authentication, payment, and real-time claim tracking.

- Security Readiness – The interface should be designed so that future backend implementation can add authentication, authorization, and secure data handling.

3.3 Data Flow Diagram:

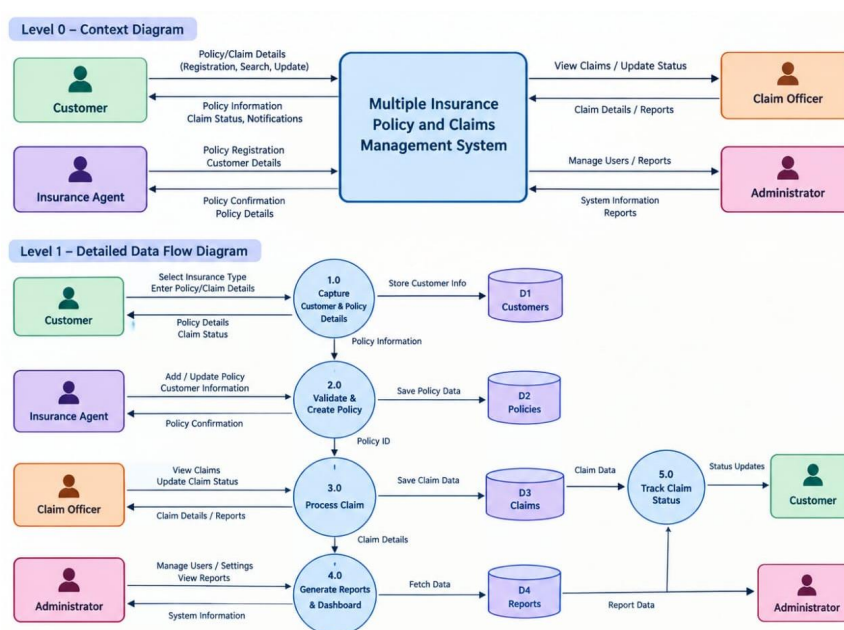

Flow:

Customer → Capture Details → Validate & Create Policy → Process Claim → Track Claim Status → Customer

Insurance Agent → Policy Details → System → Policy Confirmation

Claim Officer → Claim Details / Status Update → System

Administrator → User Management / Reports → System

Main Data Flow:

Level 0 – Context Diagram

- Customer enters policy and claim details into the system and receives policy information, claim status, and notifications.
- Insurance Agent provides customer and policy details and receives policy confirmation and policy information.
- Claim Officer views claim details and updates claim status through the system.
- Administrator manages users, system information, and reports.

Level 1 – Detailed Data Flow

- Capture Customer & Policy Details
- Customer selects the insurance type and enters policy or claim details.
- Customer information is stored for further processing.
- Validate & Create Policy
- The system validates the entered customer and policy information.
- Valid policy information is processed and stored as policy data.
- Process Claim
- Claim details are entered and processed.
- Claim information is stored and made available for claim management.
- Generate Reports & Dashboard
- The system collects policy and claim information.
- Required information is used to display dashboard details and reports.
- Track Claim Status
- Claim information is retrieved from the claim records.
- The current claim status is displayed to the customer.

3.4 Technology Stack:

The Multiple Insurance Policy and Claims Management System is developed using a simple and user-friendly frontend technology stack.

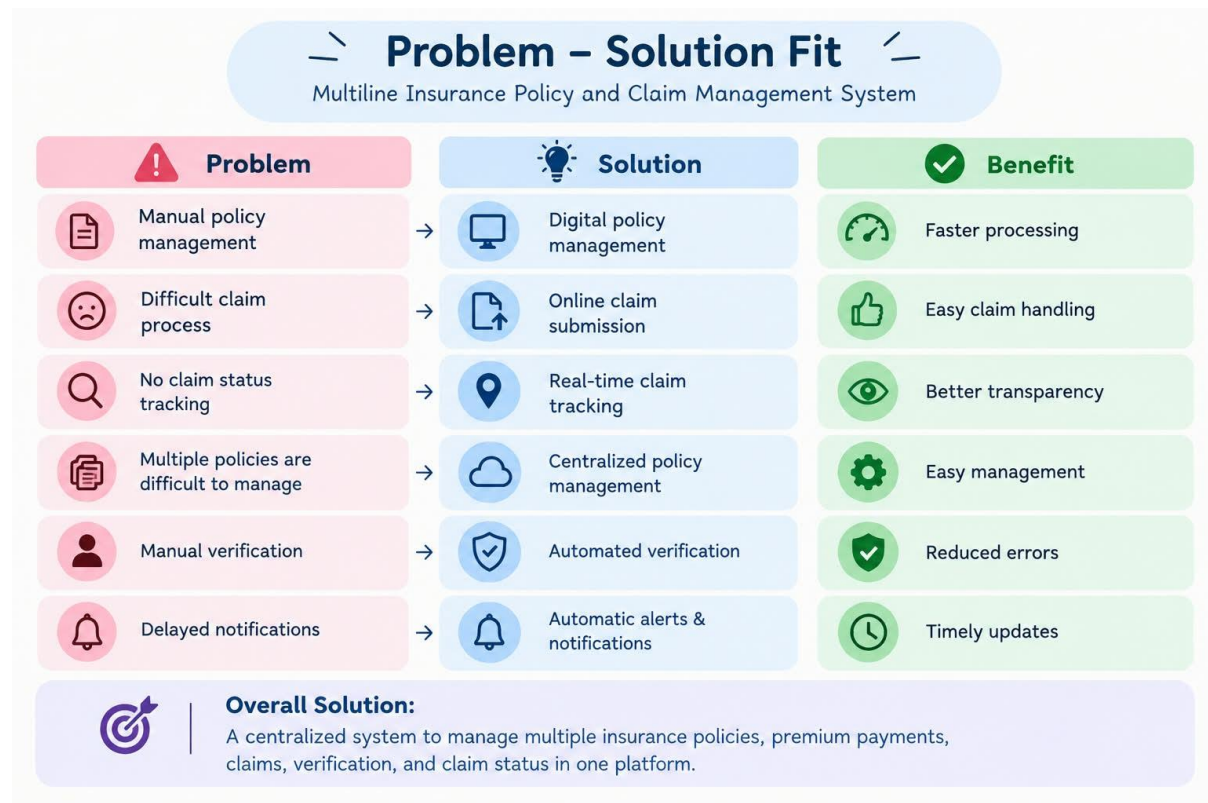

Technology	Purpose
HTML5	Used to create the structure and content of web pages
CSS3	Used for styling, layout, colours, buttons, forms, and responsive design
JavaScript	Used to add interactivity form validation, search, filtering, and dynamic content
Visual Studio Code	Used as the main development environment for writing and managing the project files
Web Browser	Used to run, test, and validate the application. Chrome, Edge, and Firefox can be used.

- **Frontend:** HTML5 + CSS3 + JavaScript
- **Development Tool:** Visual Studio Code
- **Platform:** Web Application
- **Database/Backend:** Not included in the current frontend prototype.

4. PROJECT DESIGN PHASE:

4.1 Problem Solution Fit:

The Multiple Insurance Policy and Claims Management System is designed to address the difficulties faced by customers and insurance staff in managing multiple insurance policies and claims.

4.2 Proposed Solutions:

Functional Requirements:

1. Insurance Category Management - The system shall display different insurance categories such as Vehicle, Health, Life, Home, and Travel.
2. Policy Registration - The system shall allow users to enter and register new policy details.
3. Customer Management - The system shall allow customer information to be entered and displayed.
4. Policy Viewing - Users shall be able to view policy number, premium, coverage, dates, and other policy details.
5. Policy Search - Users shall be able to search for policies using relevant details such as policy number or customer name.

6. Policy Filtering - Users shall be able to filter policies based on insurance type or policy status.
7. Policy Update - A to update available the interface.
8. Claim Submission - Customers shall be able to enter and submit insurance claim details through a structured form.
9. Claim Information Management - The system shall display claim number, policy number, claim type, date, amount, description, and status.
10. Claim Status Tracking - Users shall be able to view the current status of submitted claims.
11. Dashboard - The system shall provide a dashboard containing important policy and claim information.
12. Form Validation - The system shall validate required fields and display suitable error messages for invalid inputs.
13. Status Indicators - The system shall display clear statuses such as Pending, Approved, Rejected, and Settled.
14. Responsive Navigation to navigate between Users shall be able present modules easily on desktop and mobile screens.

4.3 Solution Architecture:

The Multiple Insurance Policy and Claims Management System follows a simple frontend-based layered architecture. It organizes the application into separate layers for better usability, maintenance, and future expansion.

Key Structure Architecture:

The key structure of the system consists of the following major components:

1. User Interface

Login/Welcome

Dashboard

Navigation Menu

Responsive Layout

2. Insurance Management

Insurance Categories

Policy Registration

Policy List

Policy Details

Policy Search & Filter

3. Customer Management

Customer Details

Policy Information

Customer Records

4. Claim Management

New Claim

Claim Details

Claim List

Claim Status

5. Dashboard & Status

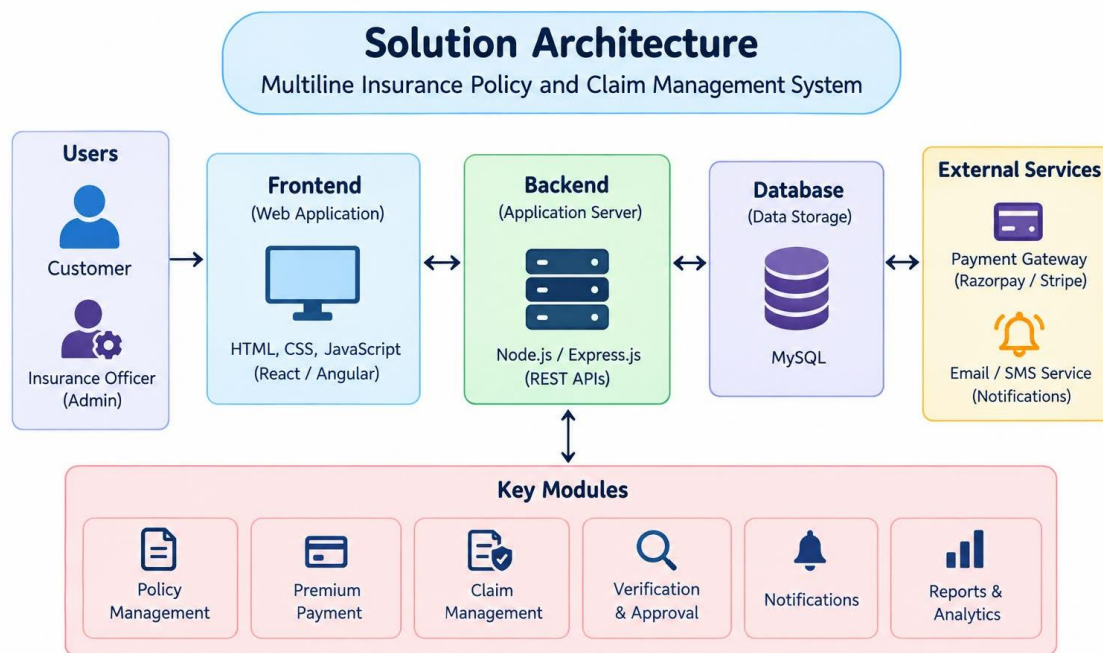

Total Policies

Total Claims

Pending Claims

Approved/Rejected Claims

Claim Tracking

5. PROJECT PLANNING & SCHEDULING:

5.1 Project Planning:

The project is planned in simple steps:

1. Requirement Analysis – Identify the project requirements.
2. Design – Design the website pages and modules.
3. Development – Develop the policy and claim modules.
4. Integration – Connect all pages and features.
5. Testing – Check the system for errors.
6. Final Review – Make corrections and complete the project.

Product Backlog, Sprint Schedule, and Estimation:

5.1.1 Product Backlog:

ID	Task	Priority
P01	Design Home/Dashboard	High
P02	Create Insurance Categories	High
P03	Create Policy Registration	High
P04	Display Policy Details	High
P05	Create Customer Details	Medium
P06	Create Claim Registration	High
P07	Claim Status Tracking	High
P08	Search and Filter	Medium
P09	Form Validation	High

P10	Responsive Design	High
P11	Testing and Bug Fixing	Medium

5.1.2 Sprint Schedule:

Sprint	Work
Sprint1	Home page, dashboard, navigation and insurance categories
Sprint2	Policy registration, policy list and policy details
Sprint3	Customer details, claim registration and claim status
Sprint4	Search, filter, validation, responsive design and testing

5.1.3 Estimation:

Sprint	Estimate Time
Sprint1	2 Days
Sprint2	3 Days
Sprint3	3 Days
Sprint4	2 Days
Total	10 Days

6. PROJECT DEVELOPMENT PHASE:

What you'll learn

1. Data Modelling
2. Fields and Relationships
3. Lightning App Builder
4. Record Triggered Flows
5. Apex and Apex Triggers
6. Batch Apex
7. Scheduled Apex

Milestones:

Milestone 1: Core Data Model & Policy Configuration

User Story 1: Policy Module

1. Create **Policy Management** page.
2. Add Policy Registration form.
3. Enter Policy Number, Customer Name, Insurance Type, Premium and Status.
4. Add **Save** button.
5. Validate and display policy details.

SETUP > OBJECT MANAGER

Policy

Details

- Fields & Relationships
- Page Layouts
- Lightning Record Pages
- Buttons, Links, and Actions
- Compact Layouts
- Field Sets
- Object Limits
- Record Types
- Related Lookup Filters
- Search Layouts

Policy

Custom Object Definition Edit [Save] [Save & New] [Cancel]

Custom Object Information

The singular and plural labels are used in tabs, page layouts, and reports. Be careful when changing the name or label as it may affect existing integrations and merge templates.

Label: Example: Account

Plural Label: Example: Accounts

Starts with vowel sound: ☐

The Object Name is used when referencing the object via the API.

Object Name: Example: Account

Descriptions:

Context Sensitive Help Setting: ☒ Open the standard Salesforce.com Help & Training window ☐ Open a window using a Visualforce page

Setup Home Object Manager

SETUP > OBJECT MANAGER

Policy

Details

- Fields & Relationships
- Page Layouts
- Lightning Record Pages
- Buttons, Links, and Actions
- Compact Layouts
- Field Sets
- Object Limits
- Record Types
- Related Lookup Filters
- Search Layouts

Enter Record Name Label and Format

The Record Name appears in page layouts, key lists, related lists, lookups, and search results. For example, the Record Name for Account is "Account Name" and for Case it is "Case Number". Note that the Record Name field is always called "Name" when referenced via the API.

Record Name: Example: Account Name

Date Type: Warning: If you plan to insert a high volume of records in this object, via the API for example, use the Text data type.

Display Format: Example: A - (0000) [What is this?](#)

Optional Features

- ☒ Allow Reports
- ☒ Allow Activities
- ☒ Track Field History
- ☐ Allow in Chatter Groups
- ☐ Enable Licensing [i](#)

Object Classification

When these settings are enabled, this object is classified as an Enterprise Application object. When these settings are disabled, this object is classified as a Light Application object. [Learn more.](#)

- ☒ Allow Sharing
- ☒ Allow Bulk API Access
- ☒ Allow Streaming API Access

Deployment Status [What is this?](#)

☐ In Development

☒ Deployed

Search Status

When this setting is enabled, your users can find records of this object type when they search. [Learn more.](#)

☒ Allow Search

[Save] [Save & New] [Cancel]

User Story 2: Policy Types

1. Open **Policy Management**.
2. Create different **Insurance Types**.
3. Add types such as **Auto, Health, Life, Home, and Travel**.
4. Select the required insurance type.
5. Save the details.

The screenshot shows the 'Edit Record Type' page for 'Auto' in the 'Policy' object. The left sidebar contains navigation links: Details, Fields & Relationships, Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types (selected), Related Lookup Filters, and Search Layouts. The main content area has a header 'Edit Record Type Auto' and a sub-header 'Enter a new name for the selected record type and click Save.' Below this is a 'Record Type' form with fields for 'Record Type Label' (Auto), 'Record Type Name' (Auto), 'Namespace Prefix', and 'Description'. There is also a checkbox for 'Active' which is checked. At the bottom are 'Save' and 'Cancel' buttons.

User Story 3: Policy Details

1. Create **Field Sets** for policy-specific details.
2. Add fields such as **Policy Number, Insurance Type, Premium, and Coverage**.
3. Arrange the required fields in the policy form.
4. Save the field set.
5. Repeat for other insurance types.

The screenshot shows the 'Vehicle Fields' configuration page for the 'Policy' object. The left sidebar is the same as in the previous screenshot, with 'Field Sets' selected. The main content area has a header 'Vehicle Fields' and a sub-header 'Field Set Properties'. Below this is a 'Quick Find' search bar and a table of fields. The table has columns for 'Field Name', 'Deleted', 'Last Referenced Date', 'Policy Number', 'Premium', and 'System Modstamp'. The fields listed are: Created By ID, Customer, Created By, Last Modified By ID, Owner ID, Record Type ID, Beneficiary Name, Deleted, Last Activity Date, Last Viewed Date, Policy Start Date, Record ID, VIN, Created Date, Last Modified By, Model Year, Policy State, Record Type, Year Built, Customer, Last Modified Date, Owner, Policy Term Months, Square Footage. Below the table is a section 'Available for the Field Set' with a yellow box saying 'Drag and drop the fields you want administrators to have available to add to the Field Set.' and a section 'In the Field Set' with a box containing 'VIN' and 'Model Year'.

User Story 4: Create Fields in Policy Object

1. Add fields to the **Policy** module.
2. Create fields such as:
 - Policy Number
 - Customer Name
 - Insurance Type
 - Premium Amount
 - Coverage Amount
 - Policy Start Date
 - Policy Status
3. Set the required fields in the policy form.
4. Save the fields and update the policy page.

User Story 5: Create Claim Module

1. Create the **Claim Management** module.
2. Add Claim Number, Customer Name, Policy Number, Claim Type, Amount and Status.
3. Set Claim Number as the unique identifier.
4. Enable search and save the claim details.

The image displays two screenshots of the Salesforce Setup interface, specifically the 'Object Manager' section for the 'Claim' object.

The top screenshot shows the 'Custom Object Information' section. The 'Label' is set to 'Claim', and the 'Plural Label' is 'Claims'. The 'Object Name' is 'Claim'. The 'Description' field is empty. The 'Context-Sensitive Help Setting' is set to 'Open the standard Salesforce.com Help & Training window'. The 'Enter Record Name Label and Format' section is also visible.

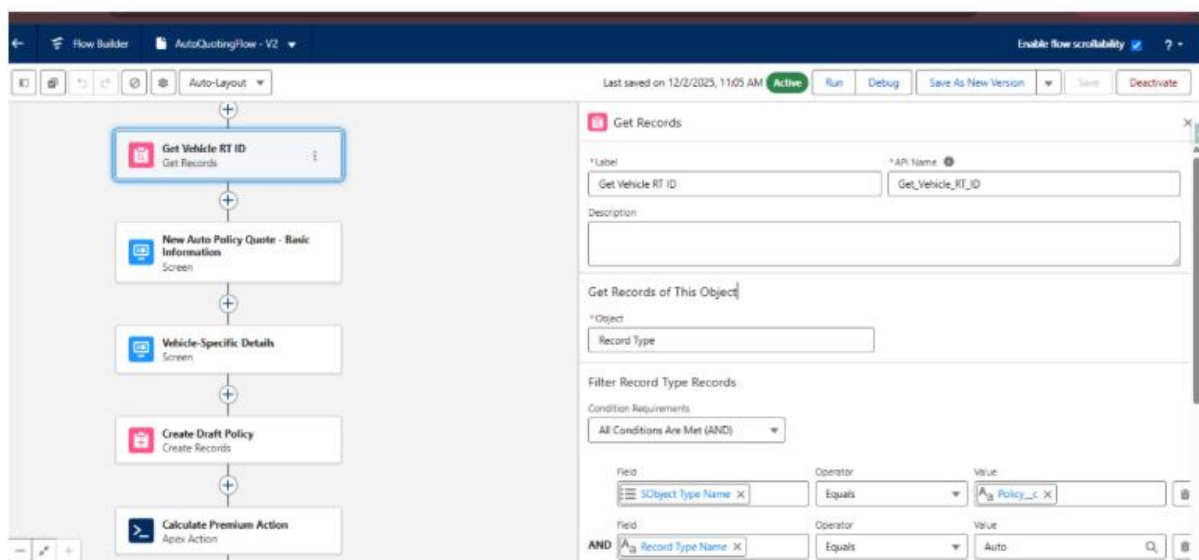

The bottom screenshot shows the 'Optional Features' section. The 'Allow Reports' checkbox is checked. The 'Allow Activities' checkbox is checked. The 'Track Field History' checkbox is checked. The 'Allow in Chatter Groups' checkbox is checked. The 'Enable Licensing' checkbox is checked. The 'Object Classification' section shows 'Allow Sharing' checked, 'Allow Bulk API Access' checked, and 'Allow Streaming API Access' checked. The 'Deployment Status' section shows 'In Development' selected.

User Story 7: Create Fields in Claim Object

1. Add fields to the **Claim Management** module.
2. Create fields such as:
 - Claim Number
 - Policy Number
 - Customer Name
 - Claim Type
 - Claim Amount
 - Claim Date
 - Claim Status
3. Set the required fields in the claim form.
4. Save the claim fields.

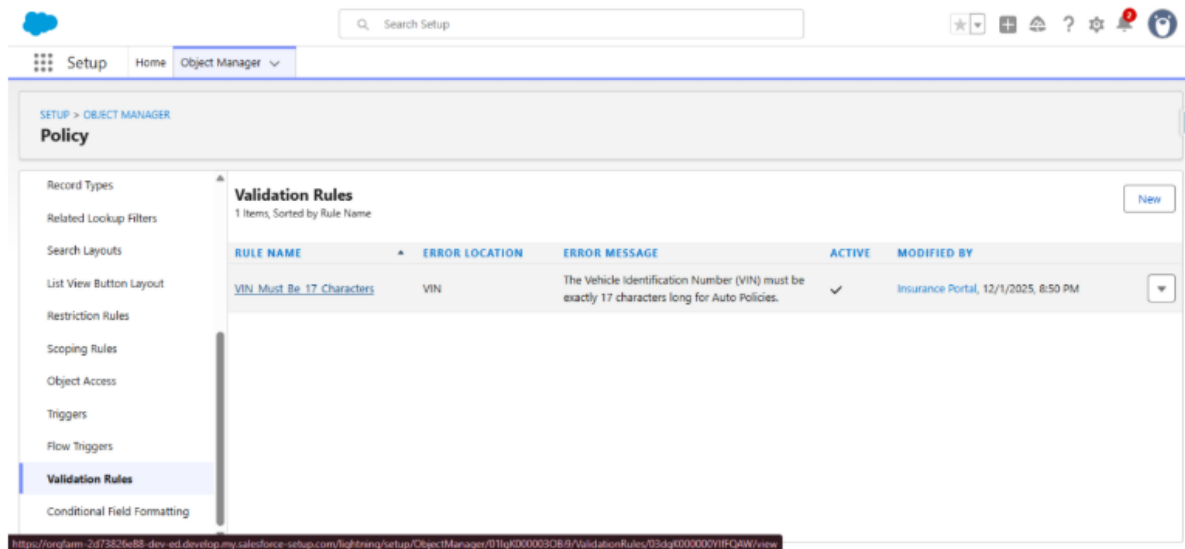

User Story 8: AutoQuoting Screen

1. Open **Flow Builder** and create a new **Screen Flow**.
2. Add a **Get Records** element.
3. Select the **Policy** object.
4. Set conditions for **Policy** and **Auto** record type.
5. Save the flow.

User Story9: Create Validation Rule on Policy Object

- Go to object manager, Search for the policy object and click on policy object
- In the left side panel, scroll down and find validation rules and click on it
- Click on New

7. TESTING AND VALIDATION:

7.1 Testing Objective:

Testing is performed to verify that all application modules work correctly and that users can navigate through the system without errors.

7.2 Test Cases:

Test ID	Test Case	Expected Result
TC01	Open application	Application loads correctly
TC02	Click dashboard	Dashboard opens
TC03	Open policy Module	Policy page opens
TC04	Submit empty policy form	Validation message appears
TC05	Submit valid policy	Policy information is accepted
TC06	Search policy	Matching policy is displayed
TC07	Filter policy	Selected category is displayed
TC08	Open claim form	Claim form opens
TC09	Submit empty claim	Required field messages appear

TC10	Submit valid claim	Claim information is displayed
TC11	Check claim status	Layout adjusts correctly
TC12	Test Mobile Screen	Correct status is displayed

7.3 Types of Testing:

Functional Testing

Checks whether each feature works according to its requirement.

Form Validation Testing

Checks required fields and invalid inputs.

Navigation Testing

Checks whether all buttons and links open the correct pages.

Responsive Testing

Checks the interface on different screen sizes.

Usability Testing

Checks whether users can understand and use the application easily.

Browser Testing

Checks the application in modern browsers.

8. ADVANTAGES AND LIMITATIONS:

8.1 Advantages:

- ✓ Easy management of multiple insurance categories.
- ✓ Simple and user-friendly interface.
- ✓ Faster access to policy information.
- ✓ Easy claim registration.
- ✓ Easy claim status tracking.
- ✓ Search and filtering facilities.
- ✓ Reduced paperwork.
- ✓ Responsive design.
- ✓ Organized policy and claim information.
- ✓ Easy to expand in the future.

8.2 Limitations:

Since the current project is focused on the frontend, it has some limitations:

- ✓ No real-time database connection.

- ✓ No permanent server-side data storage.
- ✓ Real user authentication is not implemented.
- ✓ Real payment processing is not included.
- ✓ Real-time claim processing is not available.
- ✓ External insurance services are not connected.
- ✓ Backend-based role management is not implemented.

9. CONCLUSION:

- The Multiple Insurance Policy and Claims Management System provides a centralized and user-friendly interface for managing insurance policies and claims.
- The system organizes policy information, customer details, claim registration, claim status, search, and filtering into separate modules.
- The frontend implementation demonstrates how a digital insurance management platform can simplify the traditional insurance workflow.
- Although the current implementation focuses on the frontend, it provides a strong foundation for future integration with a backend, database, authentication system, payment gateway, and real-time claim processing services.

10. FUTURE SCOPE:

The system can be enhanced in the future with the following features:

10.1 Backend Integration

A backend server can be added to process and store application data.

10.2 Database Integration

MySQL, MongoDB, Firebase, or another database can be used for permanent storage.

10.3 Secure Authentication

Login and role-based authentication can be implemented.

10.4 Online Premium Payment

Users can pay insurance premiums through an integrated payment gateway.

10.5 Document Upload

Users can upload documents related to policies and claims.

10.6 Email and SMS Notifications

Automatic notifications can be sent for policy expiry and claim updates.

10.7 Real-Time Claim Tracking

Users can track the progress of claims in real time.

10.8 Mobile Application

The system can be converted into an Android/iOS application.

10.9 AI Integration

AI can be used for claim classification, customer support, and document analysis.

10.10 Analytics Dashboard

Advanced charts and reports can be added to analyze policies, premiums, and claims.

11. APPENDIX

11.1 Project Information

Item	Details
Project name	Multiple Insurance Policy and Claim Management System
Project type	Web application
Application focus	Insurance policy and claim management
Frontend	HTML5, CSS3, javascript
Development tool	Visual studio code
Main Modules	Dashboard, Policies, Customers, Claims, Search and Status
Users	Customers, Agents, Claim Officers, Administrators
Testing	Functional, Valiadation, Responsive and Usability Testing

11.2 Sample Policy Information

- Policy Number
- Customer Name
- Insurance Type
- Policy Start Date
- Policy Expiry Date
- Premium Amount
- Coverage Amount
- Policy Status

11.3 Sample Claim Information

- Claim Number
- Policy Number
- Customer Name

- Claim Type
- Claim Date
- Claim Amount
- Claim Description
- Claim Status

11.4 Possible Claim Status

- Submitted
- Under Review
- Approved
- Rejected
- Settled
- 11.5 Possible Policy Status
- Active
- Pending
- Expired
- Cancelled
